

The evidence of ILECs sabotaging the competitors despite their current "dominant" classification is well known. Ordering a DSL connection with an ILEC's competitor is likely to take months, while the ILEC's own DSL will be installed in a matter of days. The discrepancy can not be reasonably explained by the flaws of the competition -- ILEC's (I speak from experience with Verizon) are not cooperating.

By classifying them as non-dominant you'll make it even easier for them to stifle competition and abuse their monopoly power.
